SUMMARY

This report details the results of a black cockatoo habitat assessment over a section of Lot 4201 (the survey area) (Figure 1 and Figure 2).

It is understood that Leeuwin Civil (with permission of the landowners) are investigating the viability of expanding an extractive industry at the site, which to proceed will require the clearing of up to 20 hectares (ha) of remnant native vegetation.

To facilitate the clearing Leeuwin Civil will soon be applying for a clearing permit from the Department of Water and Environmental Regulation (DWER). The habitat survey reported on here has been carried out to support the application.

The field component of the assessment was carried out on the 24, 25 and 26 February 2021 by Greg Harewood (Zoologist).

Key Findings

The survey area has a total extent of about 20 hectares and is almost completely covered with a Jarrah (*Eucalyptus marginata*) – Marri (*Corymbia calophylla*) woodland/open forest on a subtle topographical high composed of a sandy gravel substrate. The remnant contains little midstorey vegetation with only occasional/very occasional sheoak (*Allocasuarina fraseriana*), bull banksia (*Banksia grandis*), peppermint (*Agonis flexuosa*) and Kingia (*Kingia australis*). Native ground cover vegetation is absent with introduced grasses dominating

With respect to fauna in general most of the survey area has low habitat values which has resulted as a consequence of historical and ongoing disturbances such livestock grazing and firewood collecting/logging. The survey area is almost completely covered with a Jarrah (*Eucalyptus marginata*) – Marri (*Corymbia calophylla*) woodland/open forest on a subtle topographical high composed of a sandy gravel substrate, however the remnant contains little midstorey vegetation. Native ground cover vegetation is absent with introduced grasses dominating.

The habitat tree assessment identified 915 trees within the survey area with a DBH of \geq 50cm. The vast majority of these trees (851) appeared to not contain hollows of any size. Fifty seven (57) trees contained apparent or obvious hollows, all of which were assessed as being unlikely to be suitable for black cockatoos to currently use for nesting purposes, due to the hollows apparent small size, unsuitable orientation and/or height above ground level.

Seven (7) trees were assessed as containing one or more hollows potentially suitable for black cockatoos to use for nesting purposes as they appeared to be of a suitable size, with a favourable orientation. None of the hollows showed any conclusive evidence of actual use by black cockatoos for nesting purposes.

Evidence of all three species of black cockatoos foraging with the survey area was observed at a number of locations. The evidence was in all cases in the form of chewed fruits from marri trees. The foraging activity was attributed to the forest red-tailed black cockatoo, Carnaby's or Baudin's black cockatoos depending on the nature of the chew marks left on the fruits. Given the dominance of jarrah and marri within the survey area the entire remnant (~20 ha) can be regarded as representing quality foraging habitat for black cockatoos.

No roost sites were identified within the survey area with the closest documented roost site being located about six kilometres north east of the survey area.

If the Department of Water and Environmental Regulation approve a clearing permit based on the information provided it is recommended that immediately prior to any clearing taking place, vegetation to be removed be inspected by a suitably qualified "fauna specialist" for the presence of fauna so that the appropriate management measures can be employed. In particular, while the use of the area by black cockatoo for breeding has not been confirmed, the seven trees identified as containing large hollows should be closely monitored prior to works commencing.

1. INTRODUCTION

This report details the results of a black cockatoo habitat assessment over a section of Lot 4201 (the survey area) (Figure 1 and Figure 2).

It is understood that Leeuwin Civil (with permission of the landowners) are investigating the viability of expanding an extractive industry at the site, which to proceed will require the clearing of up to 20 hectares (ha) of remnant native vegetation. To facilitate the clearing Leeuwin Civil will soon be applying for a clearing permit from the Department of Water and Environmental Regulation (DWER). The habitat survey reported on here has been carried out to support the application.

Information obtained as part of this fauna assessment report will be used in conjunction with other environmental investigations to guide project planning and will also be used in the formulation of management plans, both of which will aim to minimise potential environmental impacts. The information presented may also be used by regulatory authorities to assess the potential impact of the proposal on fauna and fauna habitats at the site during the project evaluation and approval process if required.

2. SCOPE OF WORKS

The following scope of works is proposed to fill anticipated information gaps that will be required by regulatory authorities:

- A black cockatoo habitat survey (habitat trees, foraging and roosting habitat);
- A report detailing methods and results.

Note: For the purposes of this proposal the term black cockatoo is in reference to Baudin's black cockatoo *Calyptorhynchus baudinii*, Carnaby's black cockatoo *Calyptorhynchus latirostris* and the forest red-tailed black cockatoo *Calyptorhynchus banksii naso*.

3. METHODS

3.1 FIELD SURVEYS

The field component of the assessment was carried out on the 24, 25 and 26 February 2021 by Greg Harewood (Zoologist) as described in the sections below.

3.1.1 GENERAL HABITAT ASSESSMENT

Vegetation units, landforms and soils observed during the site reconnaissance survey have been used to define broad fauna habitat types across the survey area.

3.1.2 BLACK COCKATOO HABITAT ASSESSMENT

The following methods were employed to comply with the defined scope of works and are based on Commonwealth of Australia (2012) guidelines which state that surveys for Carnaby's, Baudin's and forest red-tailed black cockatoo habitat should:

- be done by a suitably qualified person with experience in vegetation or cockatoo surveys, depending on the type of survey being undertaken;
- maximise the chance of detecting the species' habitat and/or signs of use;
- determine the context of the site within the broader landscape—for example, the amount and quality of habitat nearby and in the local region (for example, within 10 km);
- account for uncertainty and error (false presence and absences); and
- include collation of existing data on known locations of breeding and feeding birds and night roost locations.

The Commonwealth of Australia (2012) places habitats used by Black Cockatoos into the following three categories:

- Breeding Habitat;
- Foraging Habitat; and
- Night Roosting Habitat.

3.1.2.1 Breeding Habitat Assessment

The black cockatoo breeding habitat assessment identified all suitable breeding tree species within the survey area that have a diameter at breast height (DBH) equal to or greater than 50cm. The DBH of each tree was estimated using a pre-made "caliper".

Target tree species included marri, jarrah, tuart and flooded gum and any other *Corymbia/Eucalyptus* species of a suitable size that was present. Peppermints, *Banksia*, sheoak and *Melaleuca* tree species (for example) were not assessed as they typically do not develop hollows used by black cockatoos.

The location of each tree identified over the threshold DBH was recorded with a GPS and the following additional details recorded: approximate tree height, number, approximate entrance size of any hollow/possible hollow, evidence of hollow use and likelihood of representing an actual black cockatoo nest hollow. Trees observed to contain hollows (of any size/type) were marked with "H" using spray paint.

Hollow/potential hollows were placed into one of four categories, based on the size of the apparent hollow entrance, these being:

• Small = ~<5cm diameter (i.e. entrance too small for a black cockatoo);

- Medium = ~5cm-10cm diameter (i.e. entrance too small for a black cockatoo);
- Large = ~>10cm diameter (entrance large enough for a black cockatoo but hollow appears unsuitable for nesting i.e. wrong orientation, appears too small, too low or too shallow); or
- Large (cockatoo) = ~>10cm diameter (entrance appears big enough for a black cockatoo to use for nesting).

Based on this assessment, trees present within the survey area were placed into one of four categories:

- Tree <50cm DBH or an unsuitable species (these were not assessed/recorded);
- Tree <u>></u>50cm DBH, no hollows seen;
- Tree <a>50cm DBH, one or more hollows seen, none of which were considered suitable for black cockatoos to use for nesting; or
- Tree <a>50cm DBH, one or more hollows seen, with at least one considered suitable for black cockatoos to use for nesting.

For the purposes of this assessment, a tree containing a potential black cockatoo nest hollow was defined as:

Generally, any tree which is alive or dead that contains one or more visible hollows (cavities within the trunk or branches) or possible hollows suitable for occupation by black cockatoo for the purpose of nesting/breeding. Hollows that had an entrance greater than about 10cm in diameter and would allow the entry of a black cockatoo into a suitably orientated and sized branch/trunk, were recorded as a "potential nest hollow".

Identified hollows were examined using binoculars for evidence of actual use by black cockatoos (e.g. chewing/chipping around hollow entrance, scarring and scratch marks on trunks and branches).

Where the assessment was inconclusive, and if possible, trees identified as having potential black cockatoo nest hollows were subsequently examined and photographed using a drone (DJI Mavic Air/Mini).

Potential nest hollows were initially placed into one of three categories based on the type of hollow entry:

- Chimney: the hollow entry faces directly upwards in the end of the trunk;
- Spout: hollow entry which is at the end of a broken branch; or
- Side: the entry is directly into the side of the trunk or a branch with no protrusions.

After inspection with the drone suspected hollows have then been placed into one of five categories based on the observable characteristics of each hollow. The categories used were:

- Confirmed Hollow: Black cockatoos observed utilising the hollow for breeding purposes;
- Chewed Hollow: The hollow shows signs of chewing ("chipping" around or near entrance and/or internally) attributed to black cockatoo activity (in most cases indicating nesting activity, but in some cases possibly marks left by black cockatoos investigating ("prospecting") hollows);
- Unused Hollow: The hollow appears to be of a suitable size for black cockatoos to use for nesting, but no conclusive evidence of this activity seen. It should be noted that chew marks/chipping are not always evident or present on some hollows that have been used for nesting. Hollows classified as "unused" may therefore have been used for nesting but cannot be specifically classified as such. Alternatively, some "unused" hollows may not be suitable for black cockatoos as a range of characteristics, not all of which can be seen or measured, ultimately determined if a hollow will ever actually be used;
- Unsuitable Hollow: The hollow has been assessed, based on information obtained, as being unlikely to be suitable for black cockatoos (generally because of the entrance appearing to be too small or because the actual hollow or accommodating branch/tree trunk appears to be too small or as having an unfavourable orientation);
- No Hollow: A possible hollow was found upon closer inspection to not be present.

A review of available literature was carried out to determine the location/extent of any known/likely black cockatoo breeding habitat areas in the vicinity of the survey area.

3.1.2.2 Foraging Habitat Assessment

The location and nature of black cockatoo foraging evidence (e.g. chewed fruits around base of trees) observed during the field survey was recorded. The nature and extent of potential foraging habitat present was also documented irrespective of the presence of any actual foraging evidence. Foraging habitat is represented by plant species that are known to provide a food source for black cockatoos. This can be in the form of seeds, flowers and also boring grubs that are extracted from some plant species.

A review of available literature was carried out to determine the location/extent of any known/likely Black Cockatoo foraging habitat areas in the vicinity.

3.1.2.3 Night Roosting Habitat Assessment

Direct and indirect evidence of black cockatoos roosting within trees on site was noted where observed (e.g. branch clippings, droppings or moulted feathers).

A review of available literature was carried out to determine the location/extent of any known/likely black cockatoo roosting habitat areas in the vicinity.

4. SURVEY LIMITATIONS

No seasonal sampling was carried out as part of this fauna assessment. The conclusions presented are based upon field data and the environmental monitoring and/or testing carried out over a limited period of time and are therefore merely indicative of the environmental condition of the site at the time of the field assessments. It should be recognised that site conditions can change with time.

Lack of observational data on some species should also not necessarily be taken as an indication that a species is absent from the site or does not utilise it for some purpose at times.

During the survey, habitat trees with hollows were searched for. It should be noted that identifying hollows suitable for fauna species from ground level has limitations. Generally, the full characteristics of any hollow seen are not fully evident (e.g. internal dimensions). It is also difficult to locate all hollows within all trees as some are not observable from ground level.

The location of observations was recorded using a handheld GPS. The accuracy of the GPS cannot be guaranteed above a level of about 5 to 10 metres, though it should be noted that in some circumstance the accuracy can increase or decrease beyond this range.

5. RESULTS

5.1 FIELD SURVEYS

5.1.1 GENERAL HABITAT ASSESSMENT

The survey area has a total extent of about 20 ha and is almost completely covered with a Jarrah (*Eucalyptus marginata*) – Marri (*Corymbia calophylla*) woodland/open forest on a subtle topographical high composed of a sandy gravel substrate. The remnant contains little midstorey vegetation with only occasional/very occasional sheoak (*Allocasuarina fraseriana*), bull banksia (*Banksia grandis*), peppermint (*Agonis flexuosa*) and Kingia (*Kingia australis*). Native ground cover vegetation is absent with introduced grasses dominating

Example images of the fauna habitats present are provided in Table 1.

| Fauna Habitat Description | Example Images |
|---|----------------|
| Jarrah (<i>Eucalyptus marginata</i>) – Marri (<i>Corymbia calophylla</i>) Woodland/Open Forest over occasional/very occasional sheoak (<i>Allocasuarina</i> <i>fraseriana</i>), bull banksia (<i>Banksia grandis</i>), peppermint (<i>Agonis flexuosa</i>) and Kingia (<i>Kingia australis</i>) | |

Table 1: Example Images of the Fauna Habitats within the Survey area

Overall, the fauna habitats present are highly degraded given most areas appear to have been subject to considerable historical and ongoing disturbances such as livestock grazing and firewood collecting/logging. Much of the vegetation appears to be regrowth from historical clearing. The total fauna assemblage within the survey area itself is likely to be extremely depauperate as a consequence.

5.1.2 BLACK COCKATOO HABITAT ASSESSMENT

5.1.2.1 Breeding Habitat Assessment

Trees considered potentially suitable for black cockatoos to use as nesting habitat (subject to a suitable hollow being present and other factors) found within the survey area comprised the following species:

- Marri Corymbia calophylla;
- Jarrah Eucalyptus marginata; and
- Dead Unidentified *Eucalyptus* spp.

A summary of the habitat trees observed is provided in Table 2. The locations of habitat trees are shown in Figure 3. Additional details on each tree can be found in Appendix A.

| | | Number of | Number of Habitat | | Tree Speci | es |
|---|--|--|--|--------|------------|----------------------|
| Total Number of Habitat Trees (DBH > 50cm) | Number of Habitat Trees with <u>No Hollows</u> <u>Observed</u> | Mabitatmber of labitatlabitatees with HollowsbservedUnsuitable for Black Cockatoos | Trees with <u>Possible</u> <u>Hollows</u> considered <u>Potentially</u> <u>suitable</u> for Black Cockatoos | Jarrah | Marri | Dead Unidentified |
| 915 | 851 | 57 | 7 | 499 | 407 | 9 |

| Table 2: Summary of F | Potential Habitat Trees | (DBH >50cm) v | vithin the Survey area |
|-----------------------|-------------------------|---------------|------------------------|
| | | (| |

The assessment identified 915 trees within the survey area with a DBH of \geq 50cm. The vast majority of these trees (851) appeared to not contain hollows of any size. Fifty seven (57) trees contained apparent or obvious hollows, all of which were assessed as being unlikely to be suitable for black cockatoos to currently use for nesting purposes, due to the hollows apparent small size, unsuitable orientation and/or height above ground level.

Initially, 23 trees were assessed as containing possible large hollows. These were subsequently examined in better detail using a drone. Sixteen of the original 23 trees suspected of having possible large hollows were upon closer inspection found to be unsuitable for black cockatoos. This conclusion was based on the hollows actually being non-existent or too shallow/open.

Seven (7) trees were assessed as containing one or more hollows potentially suitable for black cockatoos to use for nesting purposes as they appeared to be of a suitable size and with a favourable orientation. None of the hollows showed any conclusive evidence of actual use by black cockatoos for nesting purposes.

A summary of observations made on the 23 original trees suspected of having possible large hollows is provided in the table below. More details on these trees (including photographs) are provided in Appendix B.

| Tree ID | Number of Hollows (including small hollows) | Status (BC Hollow) | Justification |
|------------|--|-----------------------------------|--|
| 64 | 2+ | Unused Hollow | Jarrah with an upward facing spout type hollow. The hollow has a large entrance. Small number of minor chew/chip marks that cannot be conclusively attributed to black cockatoo activity. Must be considered potentially suitable for black cockatoos to use for nesting purposes. |
| 71 | 2+ | Unsuitable Hollow/No Hollow | Jarrah with a possible side entry/spout type hollow and a possible large side entry hollow. Neither hollow appeared to have any depth when examined with a drone. |

 Table 3: Summary of Drone Inspection Results

| Tree ID | Number of Hollows (including small hollows) | Status (BC Hollow) | Justification |
|------------|--|-----------------------------------|--|
| 211 | 2+ | No Hollow | Dead tree with a possible upward facing spout type hollow. The hollow was found to have no depth when examined with a drone. |
| 223 | 0 | No Hollow | Dead tree with a possible upward facing chimney type hollow. The hollow was found to have no depth when examined with a drone. |
| 320 | 2+ | No Hollow | Jarrah with possible side entry/spout type hollow. The hollow was found to have no depth when examined with a drone. |
| 385 | 2+ | Unsuitable Hollow/No Hollow | Dead Jarrah with possible spout type hollow and large side entry hollow. The spout type hollow was found to have no depth when examined with a drone. The side entry hollow also has no depth and is open on several sides – appears unsuitable. |
| 394 | 1 | Unsuitable Hollow/No Hollow | Dead Jarrah with three upward facing spout type hollows. Two hollows were found to have no depth at all while the third was too shallow and small internally to be suitable for black cockatoos. |
| 403 | 2+ | Unsuitable Hollow | Marri with an angled spout type hollow. The hollow is horizontal and has little depth. It therefore appears unsuitable for black cockatoos to use for nesting purposes. |
| 505 | 0 | No Hollow | Marri with a possible chimney type hollow. The hollow was found to have no depth when examined with a drone. |
| 525 | 0 | No Hollow | Jarrah with a possible chimney type hollow. The hollow was found to have no depth when examined with a drone. |
| 600 | 2+ | Unused Hollows | Marri with a large spout type hollow and a spout type hollow. Both hollows appear of a size and orientation to be considered potentially suitable for black cockatoos to use for nesting purposes, though neither shows evidence of use for this purpose. |
| 605 | 1 | Unused Hollow | Marri with a chimney type hollow. The hollow is shrouded in branches and could not be examined closely with a drone. The hollow does however appear to have a large entrance and some depth and therefore it must be considered potentially suitable for black cockatoos to use for nesting purposes. |
| 616 | 1 | Unsuitable Hollow | Marri with a possible chimney type hollow. The hollow was found to have little depth when examined with a drone and would not be suitable for black cockatoo to use for nesting purposes. |
| 619 | 0 | No Hollow | Jarrah with two possible side entry hollows. Both hollows were found to have little or no depth when examined with the drone. |
| 625 | 1 | Unsuitable Hollow | Marri with a chimney type hollow. The hollow appears to be very shallow/open and is therefore considered unsuitable for black cockatoos to use for nesting purposes. |
| 668 | 2+ | No Hollow | Dead tree with possible upwards facing spout/side entry type hollows. Both hollows were found to have no depth when examined with a drone. |
| 677 | 1 | Unused Hollow | Dead tree with possible upwards facing spout/side entry type hollows. Both hollows were found to have no depth when examined with a drone. Several much smaller possible spout type hollows in dead branches. |

| Tree ID | Number of Hollows (including small hollows) | Status (BC Hollow) | Justification | | | | | |
|------------|--|-----------------------|--|--|--|--|--|--|
| 747 | 1 | Unused Hollow | Marri with a chimney type hollow. The hollow is shrouded in branches and could not be examined closely with a drone. The hollow does however appear to have a large entrance and some depth and therefore it must be considered potentially suitable for black cockatoos to use for nesting purposes. | | | | | |
| 755 | 2+ | Unused Hollow | Marri with a possible chimney type hollow. The hollow was difficult to examine but appears to be suitable (size and orientation) to be classified as potentially suitable for black cockatoos to use for nesting purposes. | | | | | |
| 757 | 2+ | Unsuitable Hollows | Marri with possible chimney type hollow and a side entry hollow. Side entry hollow was found to have small internal dimensions. Chimney style hollow is obstructed with branches and also appears to be very shallow. | | | | | |
| 798 | 2+ | Unused Hollow | Near dead Marri with a possible upward facing spout type hollow and a side entry hollow. The side entry hollow was found to have no depth. The upward facing spout type hollow had depth and was found to be occupied by a common brushtail possum. The hollow appears to be of a size potentially suitable for black cockatoos to use for nesting purposes but showed no evidence of previous use for this purpose | | | | | |
| 813 | 0 | No Hollows | Jarrah with a possible chimney type hollow and a spout type hollow. Neither potential hollow has any depth when examined with drone. | | | | | |
| 886 | 0 | No Hollow | Jarrah with a chimney type hollow. The hollow was found to have no depth when examined with a drone. | | | | | |

Based on available mapping, there is approximately 11,800 ha of remnant native vegetation within 12 km of the survey area (DPIRD 2020). Much of this is likely to contain "potential" breeding habitat as defined by DAWE/DWER (i.e. suitable tree species with a DBH \geq 50cm).

5.1.2.2 Foraging Habitat Assessment

The following flora species are known to be or are potentially used as a direct food source (e.g. seeds, flowers, nectar, bark or grubs) by one or more species of black cockatoo and were recorded within the survey area:

- Marri Corymbia calophylla;
- Jarrah Eucalyptus marginata;
- Bull Banksia Banksia grandis;
- Sheoak Allocasuarina fraseriana; and
- Peppermint Agonis flexuosa.

It should be noted that some of the above-mentioned species (e.g. bull banksia, sheoak and peppermint) while foraged upon on occasions would make up only a small proportion of any one bird's diet relative to more favoured plant species such as marri. Some tree species are also only represented by a small number of specimens (e.g. bull banksia, sheoak) and therefore do not contribute to the overall foraging resource to a significant degree.

Evidence of all three species of black cockatoos foraging with the survey area was observed at a number of locations. The evidence was all in the form of chewed fruits from marri trees. The foraging activity was attributed to the forest red-tailed black cockatoo, Carnaby's or Baudin's black cockatoos depending on the nature of the chew marks left on the fruits. Examples of the foraging debris observed are provided in the table below.

| Foraging Evidence Description | Example Image |
|---|---------------|
| Marri fruits – foraging activity attributed to the Forest Red- tailed Black Cockatoo. | |
| Marri fruits – foraging activity attributed to the Carnaby's Black Cockatoo. | |
| Marri fruits – foraging activity attributed to the Baudin's Black Cockatoo. | |

Table 4: Foraging Evidence Examples

Given the dominance of jarrah and marri within the survey area the entire remnant (~20 ha) can be regarded as representing quality foraging habitat for black cockatoos.

Based on available mapping there is about 11,800 ha of remnant native vegetation within 12 km of the survey area (DPIRD 2020). Much of this is likely to represent black cockatoo foraging habitat of some type.

5.1.2.3 Night Roosting Habitat Assessment

No evidence of Black Cockatoos roosting within trees located within the survey area was observed during the survey period. It is difficult to determine if trees or groves of trees within the survey area represent potential roosting habitat as a range of factors, not all of which can be observed, determine suitability. Some of the larger trees may be suitable for roosting but as indicated no actual evidence of use was seen.

A review of the 2019 Great Cocky Count database shows no documented roost sites within the survey area. The 2019 Great Cocky Count recorded the closest active roost, approximately six kilometres north east of the survey area (Site ID: BUSJINR001). This roost was being used by 10 "White-tailed Black Cockatoos" during the April 2019 survey (Peck *et al.* 2019). Another seven documented roost sites (but not necessarily in current use) occur within 12 km of the survey area.

6. CONCLUSION

The assessment within the survey area was primarily undertaken to document black cockatoo habitat.

With respect to fauna in general most of the survey area has low habitat values which has resulted as a consequence of historical and ongoing disturbances such livestock grazing and firewood collecting/logging. The survey area is almost completely covered with a Jarrah (*Eucalyptus marginata*) – Marri (*Corymbia calophylla*) woodland/open forest on a subtle topographical high composed of a sandy gravel substrate, however the remnant contains little midstorey vegetation. Native ground cover vegetation is absent with introduced grasses dominating.

The habitat tree assessment identified 915 trees within the survey area with a DBH of \geq 50cm. The vast majority of these trees (851) appeared to not contain hollows of any size. Fifty seven (57) trees contained apparent or obvious hollows, all of which were assessed as being unlikely to be suitable for black cockatoos to currently use for nesting purposes, due to the hollows apparent small size, unsuitable orientation and/or height above ground level.

Seven (7) trees were assessed as containing one or more hollows potentially suitable for black cockatoos to use for nesting purposes as they appeared to be of a suitable size, with a favourable orientation. None of the hollows showed any conclusive evidence of actual use by black cockatoos for nesting purposes.

Evidence of all three species of black cockatoos foraging with the survey area was observed at a number of locations. The evidence was in all cases in the form of chewed fruits from marri trees. The foraging activity was attributed to the forest red-tailed black cockatoo, Carnaby's or Baudin's black cockatoos depending on the nature of the chew marks left on the fruits. Given the dominance of jarrah and marri within the survey area the entire remnant (~20 ha) can be regarded as representing quality foraging habitat for black cockatoos.

No roost sites were identified within the survey area with the closest documented roost site being located about six kilometres north east of the survey area.

If DWER approve a clearing permit based on the information provided it is recommended that immediately prior to any clearing taking place, vegetation to be removed be inspected by a suitably qualified "fauna specialist" for the presence of fauna so that the appropriate management measures can be employed. In particular, while the use of the area by black cockatoo for breeding has not been confirmed, the seven trees identified as containing large hollows should be closely monitored prior to works commencing.

DISCLAIMER

This fauna assessment report ("the report") has been prepared in accordance with the scope of services set out in the contract, or as otherwise agreed, between the Client and Greg Harewood ("the Author"). In some circumstances the scope of services may have been limited by a range of factors such as time, budget, access and/or site disturbance constraints. In accordance with the scope of services, the Author has relied upon the data and has conducted environmental field monitoring and/or testing in the preparation of the report. The nature and extent of monitoring and/or testing conducted is described in the report.

The conclusions are based upon field data and the environmental monitoring and/or testing carried out over a limited period of time and are therefore merely indicative of the environmental condition of the site at the time of preparing the report. Also it should be recognised that site conditions, can change with time.

Within the limitations imposed by the scope of services, the field assessment and preparation of this report have been undertaken and performed in a professional manner, in accordance with generally accepted practices and using a degree of skill and care ordinarily exercised by reputable environmental consultants under similar circumstances. No other warranty, expressed or implied, is made.

In preparing the report, the Author has relied upon data, surveys, analyses, designs, plans and other information provided by the Client and other individuals and organisations, most of which are referred to in the report ("the data"). Except as otherwise stated in the report, the Author has not verified the accuracy of completeness of the data. To the extent that the statements, opinions, facts, information, conclusions and/or recommendations in the report ("conclusions") are based in whole or part on the data, those conclusions are contingent upon the accuracy and completeness of the data. The Author will not be liable in relation to incorrect conclusions should any data, information or condition be incorrect or have been concealed, withheld, misrepresented or otherwise not fully disclosed to the Author.

The report has been prepared for the benefit of the Client and no other party. The Author assumes no responsibility and will not be liable to any other person or organisation for or in relation to any matter dealt with or conclusions expressed in the report, or for any loss or damage suffered by any other person or organisation arising from matters dealt with or conclusions expressed in the report (including without limitation matters arising from any negligent act or omission of the Author or for any loss or damage suffered by any other party relying upon the matters dealt with or conclusions expressed in the report). Other parties should not rely upon the report or the accuracy or completeness of any conclusions and should make their own enquiries and obtain independent advice in relation to such matters.

The Author will not be liable to update or revise the report to take into account any events or emergent circumstances or facts occurring or becoming apparent after the date of the report.
